PWLLHELI SAILING CLUB

Pwllheli Race Officer

Race Officer's Guide

Running a series of races and publishing results

Covers app version 1.020

Internal race-office reference · human-supervised prototype

Copyright © 2026 CapeNet Ltd. MIT licence.

BEFORE YOU BEGIN

About this guide

This guide is for the race officer or race-office volunteer running club racing on the Pwllheli Race Officer application. It follows one continuous journey: setting up a series, creating and running each race in that series from the warning signal to the finish, and publishing results so competitors and the club website can see them.

It deliberately does not cover first-time installation, or configuring hardware such as the start-hut horn, finish camera or weather station — those are covered in the Settings & Admin and Hardware documentation that ships with the app, in the **docs/** folder. This guide assumes the race-office PC is already set up and you have a login.

IMPORTANT

Pwllheli Race Officer is a **human-supervised** tool. It times starts, records finishes, calculates corrected results and publishes them — but the race officer and race committee remain responsible for every official decision: physically hoisting and lowering the correct flags, judging recalls and abandonments, and handling protests or redress. Always verify what the app shows against what is actually happening on the water before you rely on it.

What this guide covers, in order:

- Logging in and reading the dashboard
- Key concepts: series, races, warning signals, rating systems and scoring, in plain language
- Setting up a series: discards, rating-band classes and a default start plan
- Creating a race, setting its course and warning-signal time, and adding entries
- Running the start sequence, shortening the course if the wind drops, and recording finishes
- Viewing race and series results
- Publishing results to the club website
- A good-practice checklist for race day

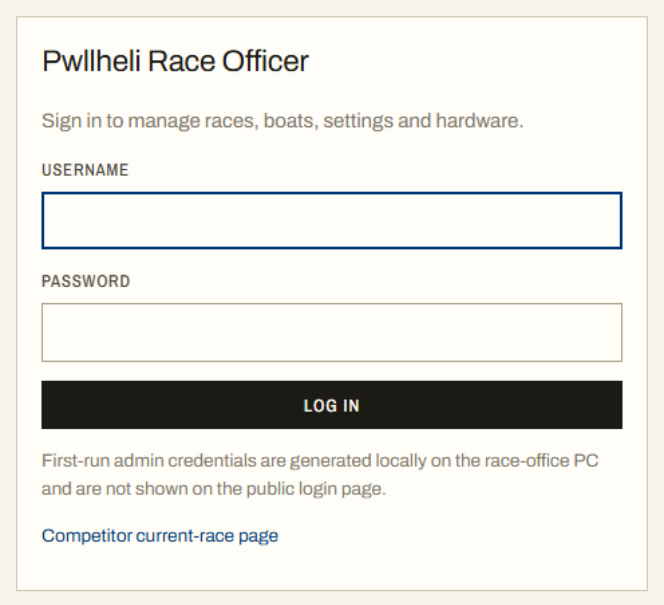

Copyright © 2026 CapeNet Ltd. MIT licence.

CHAPTER 1

Getting started

1.1 Logging in

Open the app in a browser on the race-office PC (normally **http://localhost:5050/admin**, or the PC's address from another device on the club network) and sign in with your username and password.

The sign-in page. The public competitor page does not require a login — only the race-office side does.

NOTE

The very first admin account's password is generated automatically on the race-office PC and saved to **runtime/initial_admin_password.txt** — it is not shown on this page. Your club may have since created named accounts for each race officer under Settings → Users.

NOTE

Accounts come in two roles. A **race officer** account can do everything in this guide, but **Settings is read-only** and restoring a backup is reserved for an **admin** account. If Settings looks greyed-out with a "read-only" note, you're signed in as a race officer — ask an admin to make configuration changes.

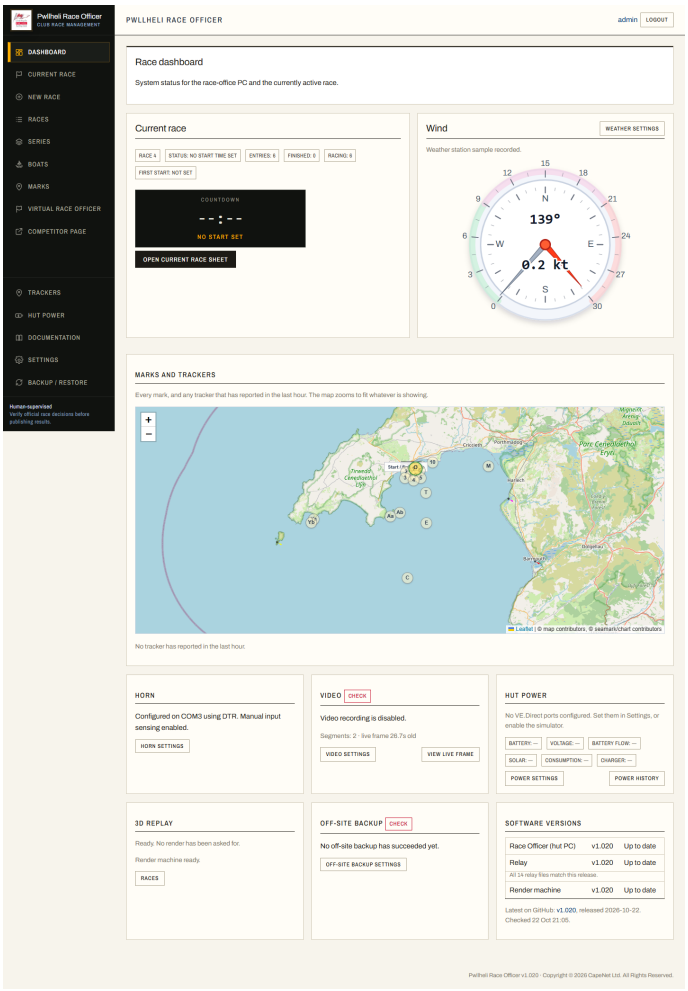

NOTE

To change your **own password**, click your username in the top bar to open the **My account** page. This works whatever your role — you don't need admin access to change your own password. Enter your current password to confirm, then the new one. Administrators can also reset any user's password from Settings → Users.

1.2 The dashboard

Copyright © 2026 CapeNet Ltd. MIT licence.

After signing in you land on the **Dashboard**. It is a single at-a-glance view of race-office status: the currently active race and its countdown clock, the live wind reading, the marks and any trackers reporting, whether the horn and video systems are configured, and whether the club's software is on the latest release (the **Software versions** card links to a newer one when it is out). Everything on it is something that changes during a day; the club's standing start-line, finish-line and radio notes belong to the Sailing Instructions and are no longer repeated here.

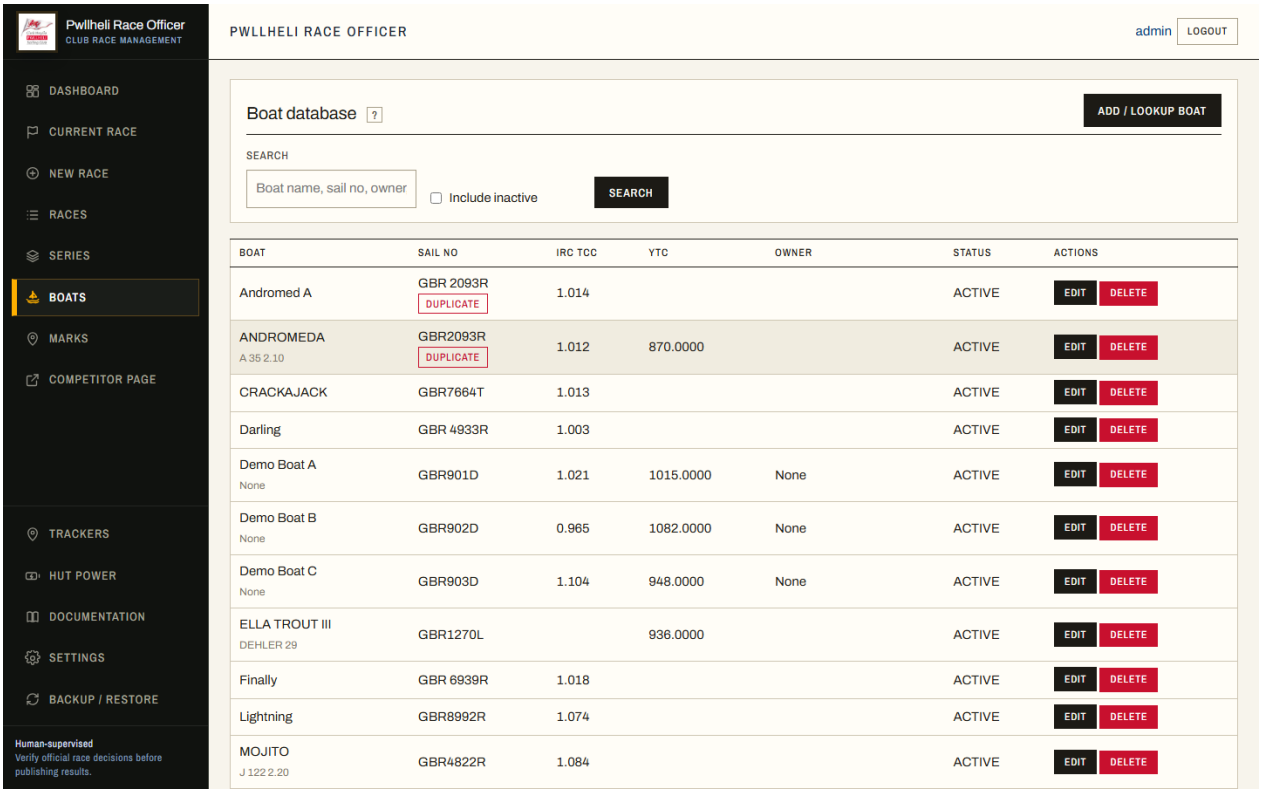

The Dashboard. “Current race” always tracks the most relevant race — this is also what the public competitor page shows by default.

If the hut runs off-grid, a **Hut power** card also shows the battery charge, solar input and hut consumption from the Victron devices, with a fuller history graph under **Hut power** in the sidebar (grouped with Documentation and Backup). Setting it up is covered in the Reference Manual.

1.3 Check your boats before the series starts

The **Boats** database stores every boat once, with both its IRC and YTC ratings, so you do not have to re-type them for every race. Before starting a new series it is worth a quick check that ratings are current — add any new boats and update any changed ratings here first.

Copyright © 2026 CapeNet Ltd. MIT licence.

The Boat database. Boats can be looked up from the IRC/YTC rating lists or entered manually.

> **NOTE**
>
> Ratings are copied into a race as a **snapshot** the moment a boat is added to that race — they are not looked up live afterwards. If you correct a boat's rating in the database, it will apply to races you add that boat to *from now on*, not to entries already created. You can still edit an individual entry's rating on the race's “Entries & finish times” tab if a correction is needed after the fact.

Copyright © 2026 CapeNet Ltd. MIT licence.

CHAPTER 2

Key concepts, in plain language

A handful of ideas recur throughout the app. It is worth understanding them before setting up your first series — they explain why some settings live on the series and others on the individual race.

Series and race

A **series** (e.g. “Autumn Series 2025”) is a named group of races that are scored together over a season, with discards. A **race** is one race sheet: one start, one course, one set of entries and finish times. A race can belong to a series, or stand alone.

First warning signal vs. first start

You set the **first warning signal** time on a race. The actual **first start** is always five minutes later. Every other start in a multi-start race plan is defined as an offset in minutes from that first start, not from the warning signal.

IRC and YTC

Two independent handicap rating systems, scored side by side in every race and series. **IRC** corrected time = elapsed time × IRC TCC (shown to three decimal places). **YTC** corrected time = elapsed time × 1000 ÷ YTC number. A boat only appears in the table for a system it has a rating for.

Discard profile

A comma-separated list such as **0,0,1,1,1,1,2,2,2** that says how many of a competitor's worst scores are discarded once 1, 2, 3… races have been completed. If more races are sailed than there are numbers in the list, the last number is reused. Discarded scores are shown struck-through in results tables.

Series constitution

A series class is marked “constituted” once at least the configured minimum number of races (commonly 3) have been scored for it. Below that threshold, results are still shown, but labelled “Not yet constituted”.

Rating-band classes

A series can define up to three IRC and three YTC classes, each with a name, a numeral class flag, and an optional rating band (e.g. IRC Class 1 = 1.000 and above). Boats are grouped into these classes automatically by their rating.

Start plan

Up to six starts can be defined for a series, each with a time offset from the first start and a choice of which classes start on it. Classes that share both a rating system and a start are also shown combined as an “Overall” table.

Copyright © 2026 CapeNet Ltd. MIT licence.

Entry status codes

Every entry carries a status, set on the “Entries & finish times” tab. These follow standard Racing Rules of Sailing abbreviations:

CODE	MEANING
PRESTART	Entered and waiting — shown until the race's warning signal time
RACING	Started and still racing
FINISHED	Crossed the finish line — has a finish time
DNC	Did Not Compete — never entered/came to the start
DNS	Did Not Start
OCS	On Course Side — over the line early at the start
RET	Retired from the race
DNF	Did Not Finish
DSQ	Disqualified
DNE	Disqualification that is not excludable as a discard (RRS 90.3(b))
DGM	Discretionary penalty for gross misconduct

NOTE

There is no built-in protest or redress workflow. If the race committee awards redress or upholds a protest, apply the outcome by editing the affected entry's status or rating directly, then re-check the results.

Copyright © 2026 CapeNet Ltd. MIT licence.

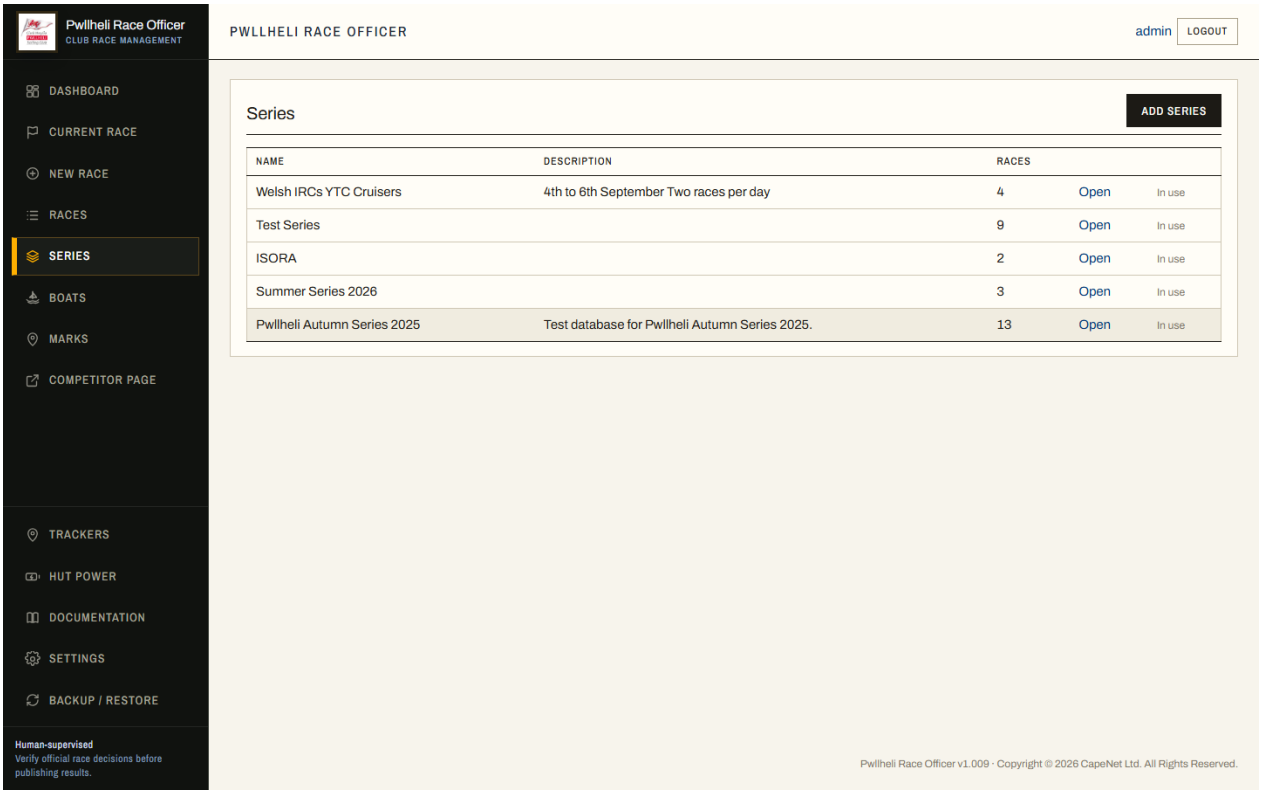

CHAPTER 3

Setting up a series

Start on the **Series** page in the side menu. A series holds the settings that every race added to it will share by default: its discard profile, its rating-band classes, and its default start plan.

3.1 Create the series

On the Series page choose **Add series**. Give it a name (e.g. “Spring Series” or “Wednesday Evening Series”) and, on the same page, set the discard profile, the rating-band classes and the default start plan — it is the same form as **Edit series details**, so a series can be set up in one pass rather than created blank and then immediately edited. Everything on it can be changed later.

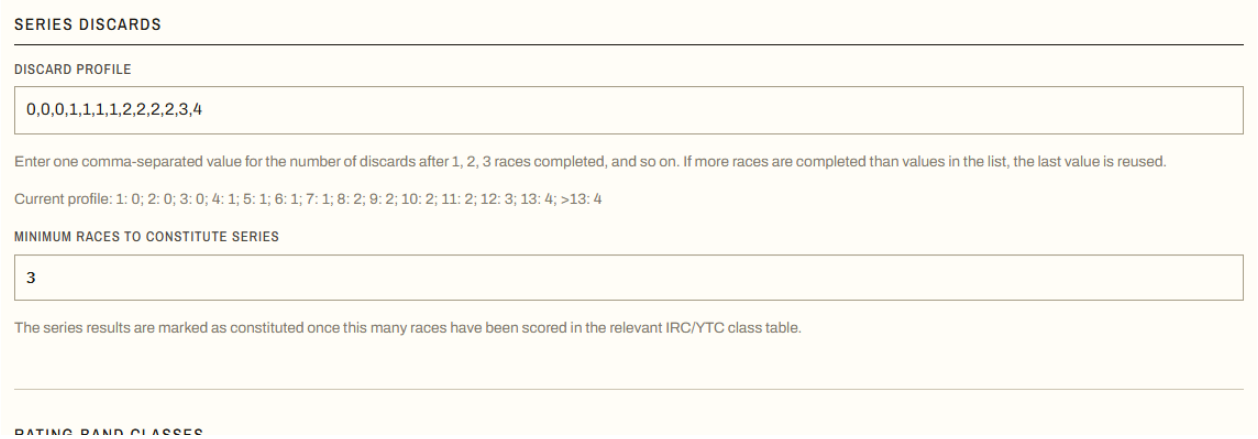

The Series page. Winter Series 2027 has no races in it yet and can be deleted; every series that has been raced shows In use instead.

3.2 Set the discard profile and constitution rule

This and the two sections that follow are all on the same form — the one you are already on when adding the series, and the one behind **Edit series details** on the series afterwards. The discard profile controls how many of each competitor's worst scores are dropped as the series progresses, and “Minimum races to constitute series” sets when a class's results stop being provisional.

Copyright © 2026 CapeNet Ltd. MIT licence.

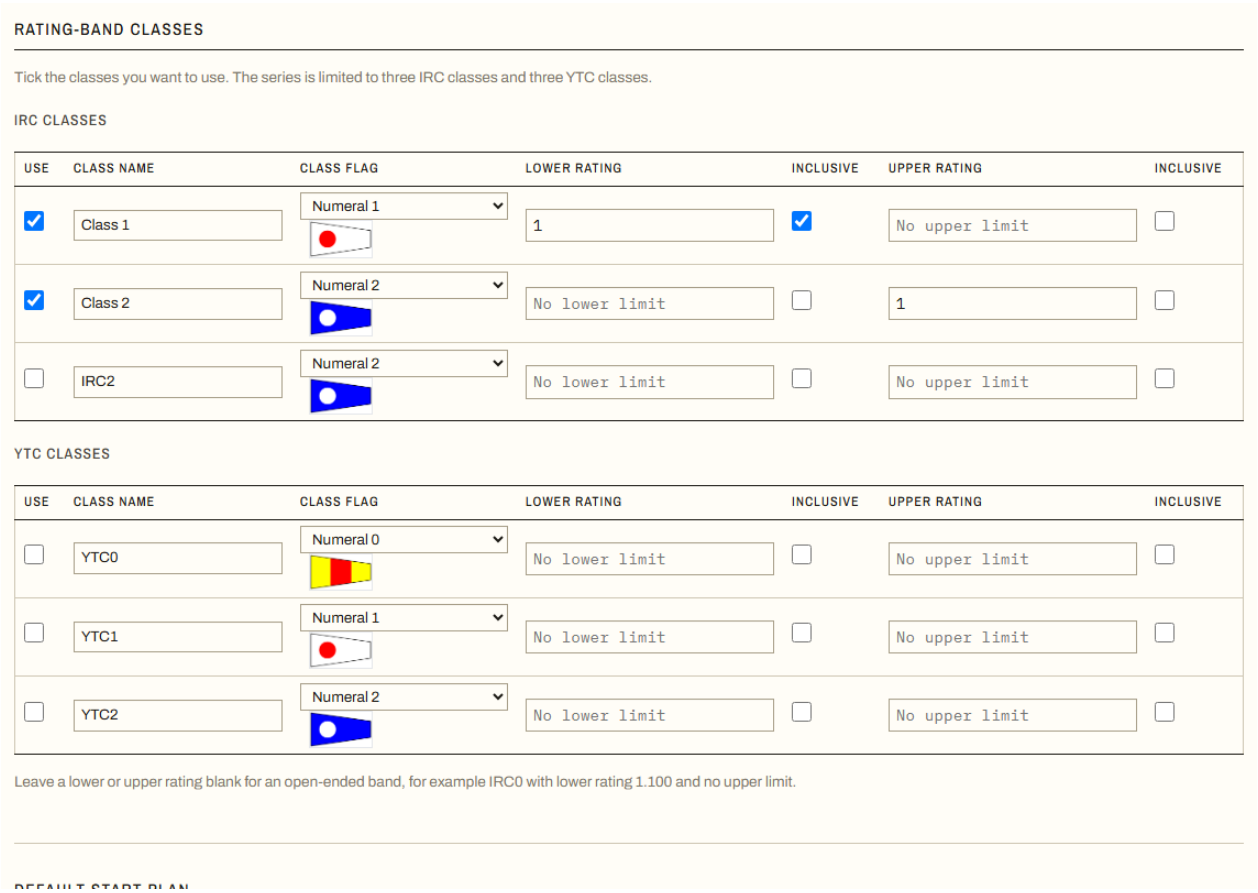

Series discard profile, constitution threshold, and the publish/export buttons this guide returns to in Chapter 11.

3.3 Define the rating-band classes

Tick up to three IRC classes and three YTC classes, name each one, choose its numeral class flag, and optionally bound it by rating (e.g. IRC Class 1 from 1.000 upwards). Leave a bound blank for an open-ended band.

On a new series **nothing is ticked**: a series created without touching this section has no bands at all and scores as one fleet per rating rule, which is what a single-fleet series wants. Tick a row only for a series that really is split by rating.

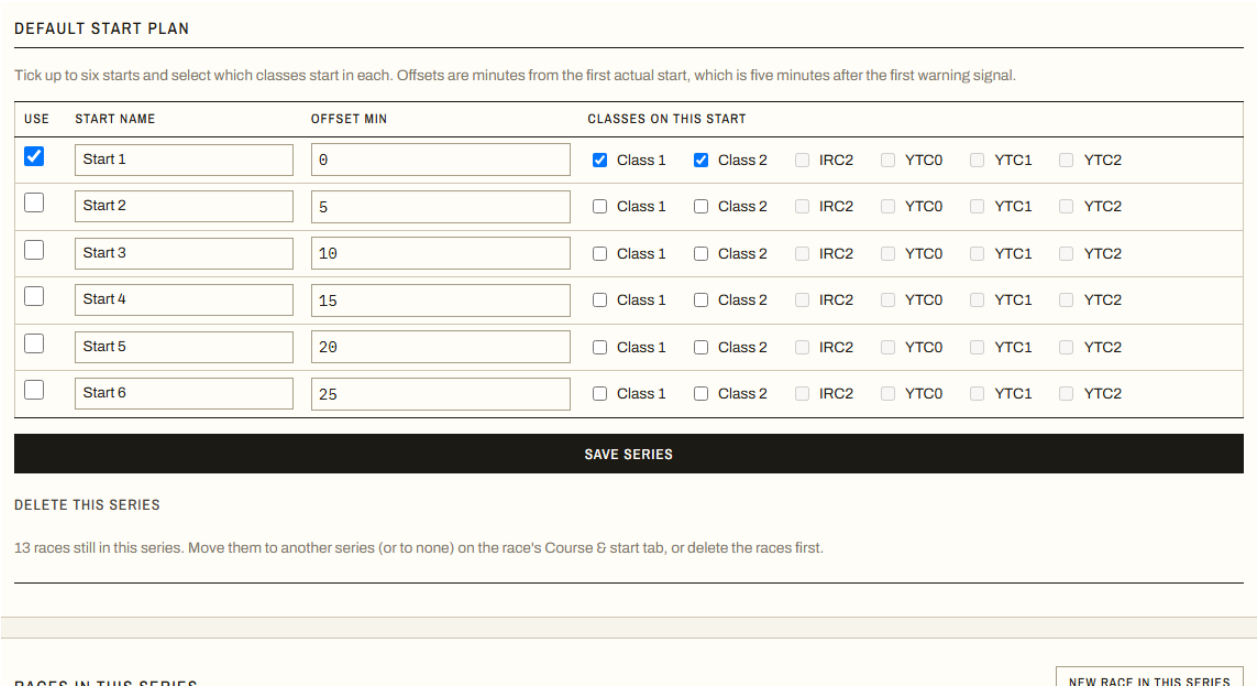

IRC rating-band classes, each with a name, numeral flag and rating band.

3.4 Set the default start plan

Copyright © 2026 CapeNet Ltd. MIT licence.

Tick up to six starts, give each an offset in minutes from the first actual start, and choose which classes start on it. This becomes the default for every new race added to the series — it can still be reviewed per race on the race's own “Course & start” tab.

The classes here follow the bands you ticked in the section above, as you tick them: a band appears on every start the moment it exists, and renaming it renames it here. Untick it from a start to give that band a start of its own — a second start five minutes later for the slower band is the usual shape.

The default start plan: offsets are minutes after the first start, which is five minutes after the first warning signal.

Select **Create series** if you are adding one, or **Save series** if you came back to it through **Edit series details**. Either way the whole form is saved together.

3.5 Deleting a series

A series can be removed — from the **Series** list, or from the bottom of **Edit series details** — but only once **no races are in it**. One that still holds racing shows *In use* where the button would be, and the series page says how many races are in the way.

To delete one that is in use, empty it first: open each race's “Course & start” tab and set its series to another one or to *(none)*, or delete the races. The button then appears.

> **NOTE**
>
> The rule is deliberate. A series is not just a label on a group of races — it carries the rating bands, the start plan and the discard profile those races were scored under. Deleting it with races still attached would drop them out of the standings while they went on claiming to belong to it.

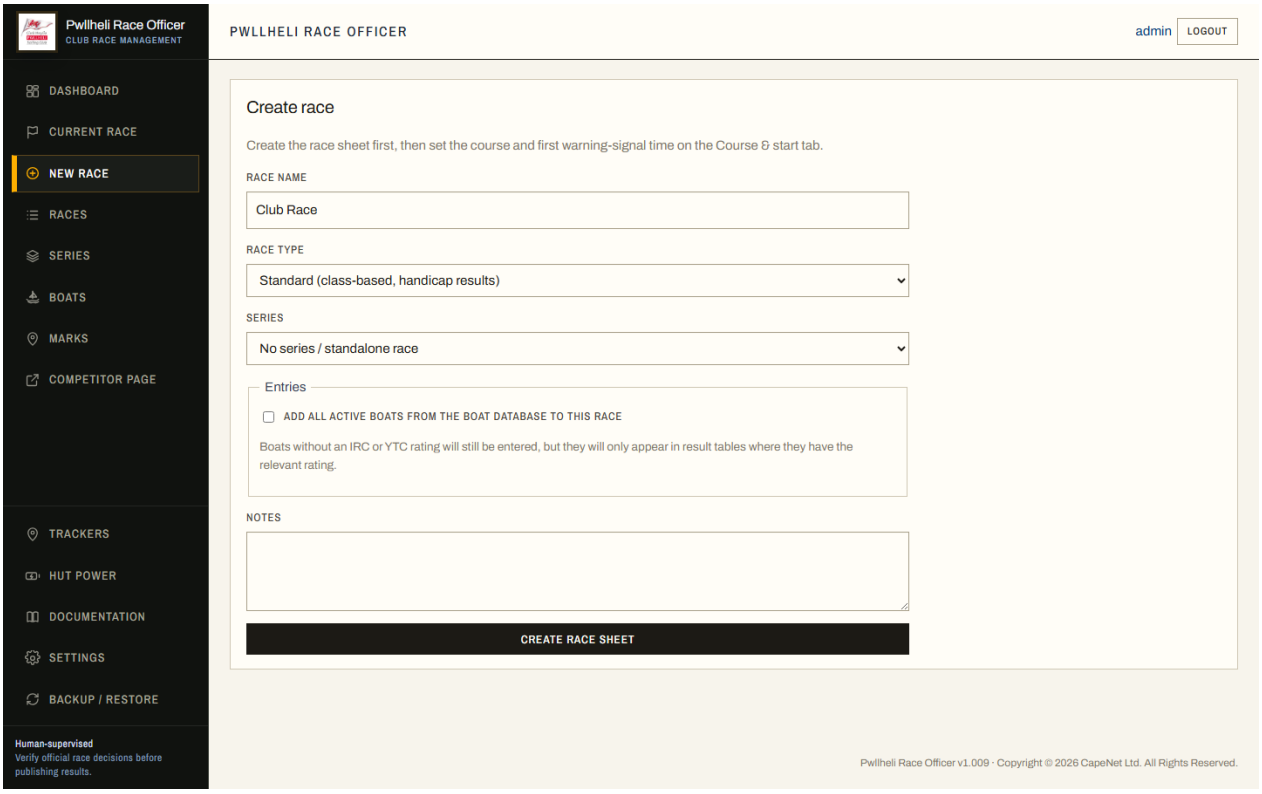

Copyright © 2026 CapeNet Ltd. MIT licence.

CHAPTER 4

Creating and setting up a race

4.1 Create the race sheet

From the Series page, use **New race in this series** (or **New race** in the side menu, then choose the series from the dropdown). Race creation is deliberately minimal: give it a name and decide whether to bulk-add every active boat from the database straight away. A race takes its classes from its series' rating bands, so there is nothing to type here about class or fleet. The course and warning-signal time are set next, on the race sheet itself.

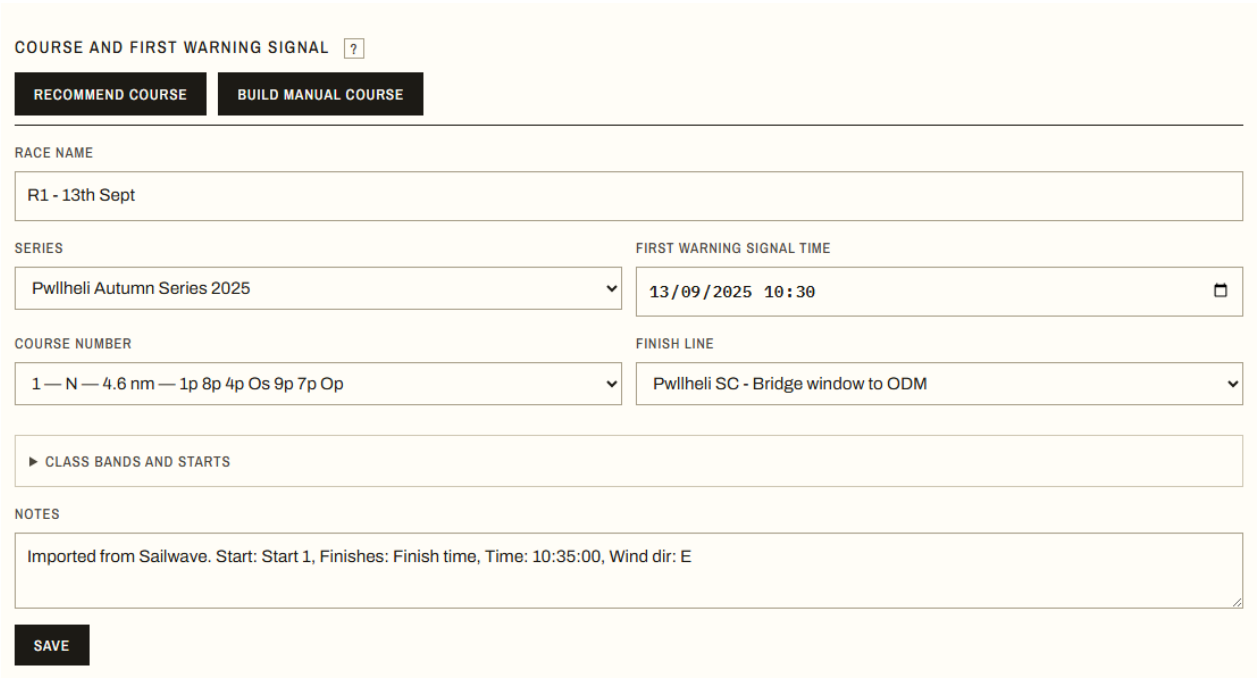

Creating a race: name, series and an optional bulk entries checkbox. Select “Create race sheet” to continue.

4.2 Set the course and warning-signal time

On the new race sheet's **1. Course & start** tab, set the **First warning signal time** — the actual start follows five minutes later automatically. Then choose a course: pick a fixed course number directly, use **Recommend course** to have the app suggest one of the club's standard courses from the live start-hut wind and a chosen boat polar, or use **Build manual course** to lay out a one-off course from individual marks. Once a manual course is active it replaces the course-number field until you clear it.

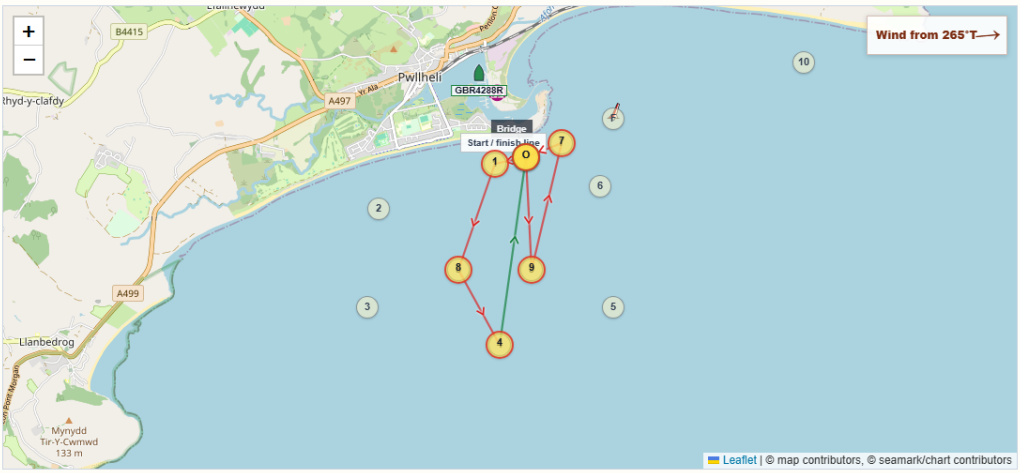

A “?” beside a heading opens the explanation. The race page keeps the controls at the top and the reasoning one click away, so what stays on screen is what changes what you do next — *AP is up since 14:02*, *this race has started*, *whole minutes only*. The *why* and the worked examples are behind the **?**, and everything in those popups is also in this manual.

▼ LEG ANALYSIS USING ODM O AS START/FINISH REFERENCE

Predicted time: 43 min · First leg: 8° Starboard · Shape: 2 upwind · 5 reach · 0 downwind · Sail changes: 4

LEG	DISTANCE	BEARING	TWA	SIDE	SAIL	TARGET	TIME	POINT
O → 1	0.21 nm	257°T	8°	Starboard	J1	5.28 kt @ 45°	3 min	Beat/VMG
1 → 8	0.74 nm	199°T	66°	Starboard	J1	6.33 kt	7 min	Close reach
8 → 4	0.57 nm	151°T	114°	Starboard	A2	6.80 kt	5 min	Beam reach
4 → O	1.26 nm	8°T	103°	Port	A2	6.97 kt	11 min	Beam reach
O → 9	0.75 nm	177°T	88°	Starboard	A0	6.92 kt	6 min	Close reach
9 → 7	0.86 nm	13°T	108°	Port	A2	6.97 kt	7 min	Beam reach
7 → O	0.25 nm	248°T	17°	Starboard	J1	5.28 kt @ 45°	3 min	Beat/VMG

Below the form: the selected course's chart, the fleet's position on the water, and the predicted leg-by-leg timing calculated from the chosen polar and the latest start-hut wind.

Courses that go round a headland

A long course west — to the Gwylan Islands, say — does not sail in a straight line, because the Ll■n peninsula is in the way. Left to itself the app draws the leg straight across the land, and it does more than look odd: it measures the leg **10.9 nm** against the **13.1 nm** actually sailed, so distance-to-go and the predicted leaderboard are a fifth short for the whole leg, and it treats one bearing of 243° as the leg when the boats really sail 211° and then 278° — a reach and a broad reach modelled as neither.

A **waypoint** fixes that. It is a turning point, not a mark: add it to the course wherever the course would otherwise cut across the land, and the course bends there. The club has two, **TC** off Trwyn Cilan and **TP** off Porth Ceiriad. In the manual course builder they have a single **Add** button instead of Port and Starboard, and show as a grey **via TC** chip.

Copyright © 2026 CapeNet Ltd. MIT licence.

NOTE

Nothing else changes. A waypoint is **not** on the course board, not in the announcement, not offered as a place to shorten the course, not counted in a boat's marks-rounded tally, and not drawn on the chart — the leg simply changes direction there. Competitors are being told the same course as before; the app is just measuring it the way they sail it. Put one on both legs of an out-and-back course.

Add a waypoint on the **Marks** page like any other mark, with the **Waypoint** box ticked, and put it in the water on the line boats actually sail — a little outside the headland. It needs no rounding radius, because nothing rounds it: a boat counts as past it once it draws level with it, however far offshore that happens. That matters on a beat, where the fleet can pass a mile or more off.

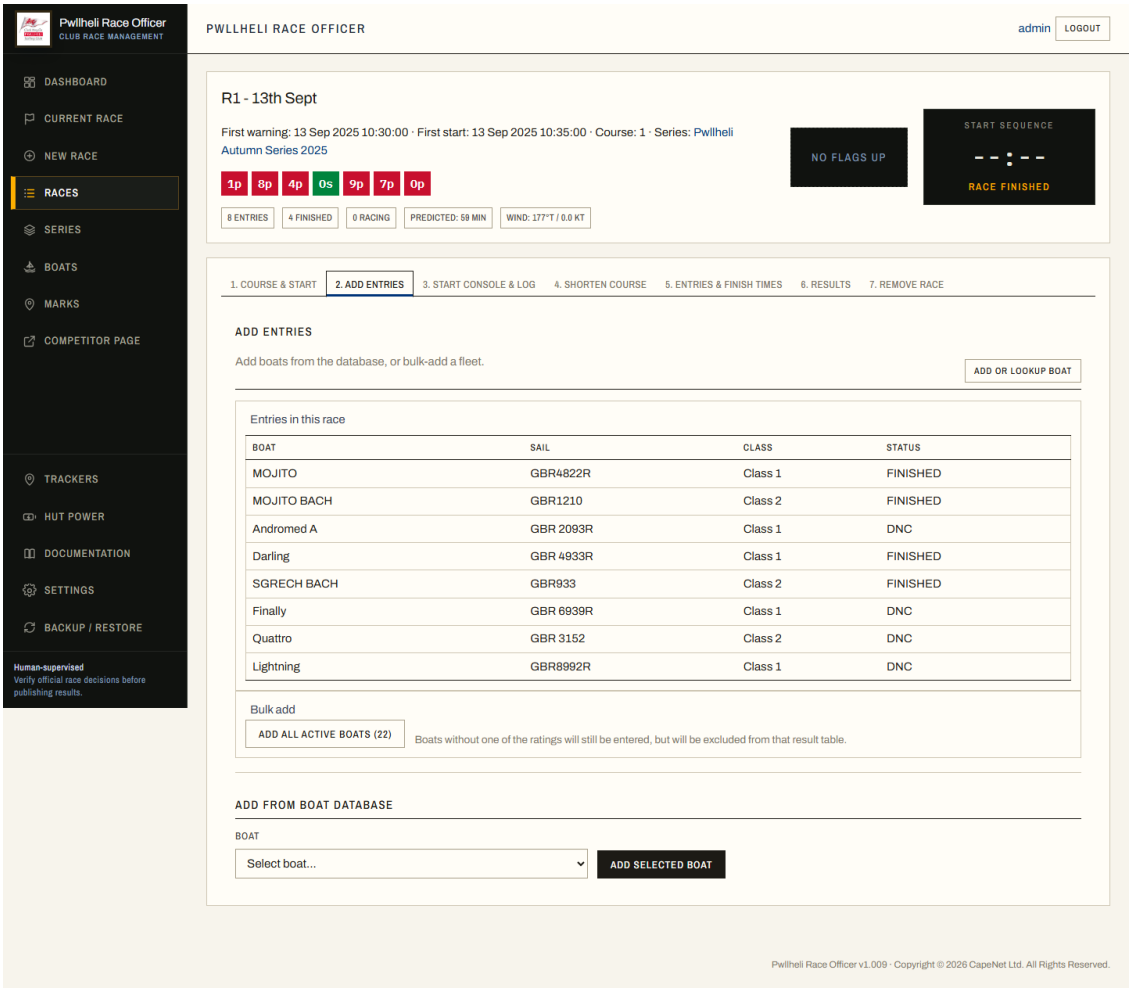

Copyright © 2026 CapeNet Ltd. MIT licence.

CHAPTER 5

Adding entries

Move to the **2. Add entries** tab. Boats are added to the race from the boat database, either one at a time or in bulk:

- **Bulk add** — add every active boat in the database, or every boat already known to be in a particular class, in one click.
- **Add from boat database** — look up one existing boat and add it, optionally overriding its class for this race.

Add entries: current entries for the race, plus the bulk-add and add-from-database controls.

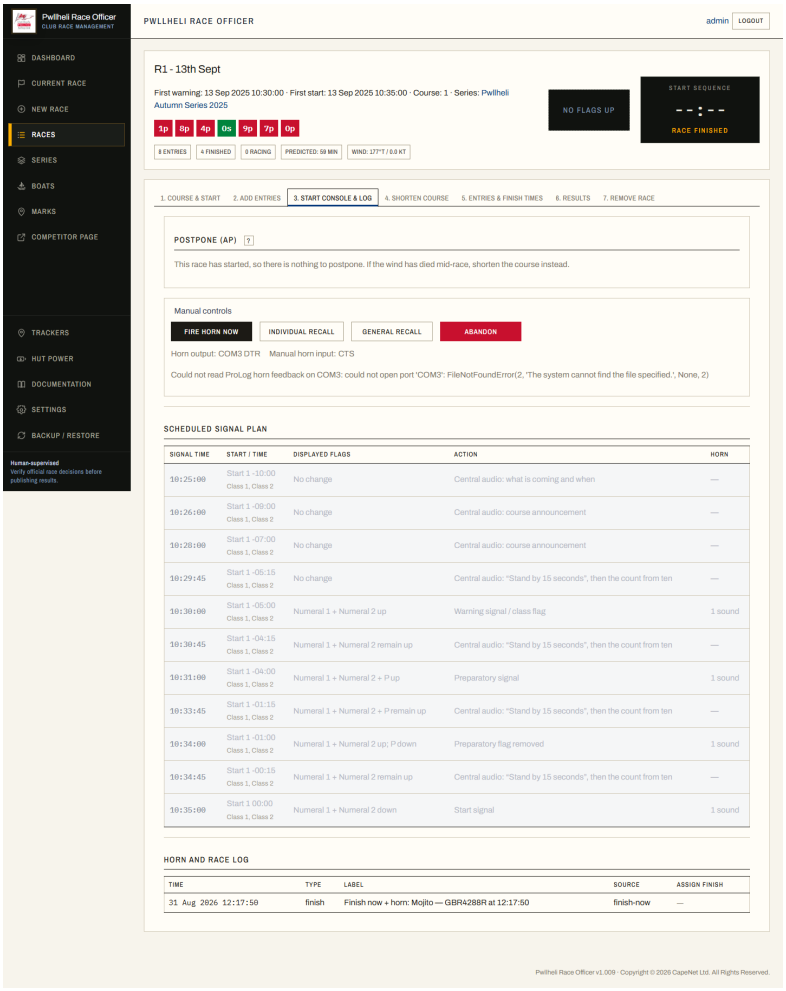

> **NOTE**
>
> Boats without a rating for a particular system are still entered — they will simply be excluded from that system's result table until a rating is added.

Copyright © 2026 CapeNet Ltd. MIT licence.

CHAPTER 6

Running the start sequence

The **3. Start console & log** tab is the working screen for race day. The **Scheduled signal plan** table is generated automatically from the warning-signal time and the start plan: it shows exactly when each flag goes up or down, when the horn sounds, and any scripted audio announcements.

Start console & log: manual controls at the top, the full scheduled signal plan below, and the horn/race event log.

The manual controls above the signal plan cover the situations the schedule cannot predict:

- **Fire horn now** — sound the horn immediately, outside the scheduled plan.
- **Individual recall** — log that one or more boats were called back over the line.
- **General Recall** — log a full recall of the start.
- **Postpone (AP)** — the real thing, not a note: two horn blasts, the start sequence held, and AP on every page that shows flags. See below.
- **Abandon** — log an abandoned race.

Copyright © 2026 CapeNet Ltd. MIT licence.

IMPORTANT

The signal panel is guidance, not a substitute for judgement. The race officer remains responsible for physically hoisting and lowering the correct flags at the right moment, and for the on-the-water decision to recall, postpone or abandon — always check the displayed flags match what is actually flying.

The start photo

At each start signal the hut camera takes a photo of the line, the start line is drawn on it from the pole to the outer distance mark, and it goes on the public race page's **Start photo** tab a few seconds after the gun — during the race, unlike the start and finish videos, so competitors can see for themselves whether they were over. The race sheet shows it beside the start video, with a link to the camera's own photo without the line or the logo: that is the one to look at when checking an OCS call. The note beside it says how long after the gun the photo was ready, and how long the camera took to answer.

IMPORTANT

The line is drawn automatically, from where the buoy was found in camera stills taken in the minute before the gun and in the photo itself — when the fleet hides the buoy at the gun, the line goes to where it was. It is a guide, not a judging line, and if the buoy cannot be found the photo goes up without one. Your OCS and recall calls stand, and the public page says so. Before the first race, **Settings** → **Camera zoom / PTZ presets** → **Save and take a test start photo** checks that the camera answers and the buoy is found.

Postponing a start (AP)

If the wind dies, the line is not ready or the fleet is not there, **postpone — do not move the start time**. Moving it signals nothing to the fleet, and if the sequence is already running it drops the rest of it: boats hear a warning, then no preparatory signal and no gun. The controls are on this tab because this is the tab you are on before a start.

- **AP** — races not started are postponed. The warning signal will be made one minute after AP is removed.
- **AP over H** — postponed, further signals ashore.
- **AP over A** — postponed, no more racing today.

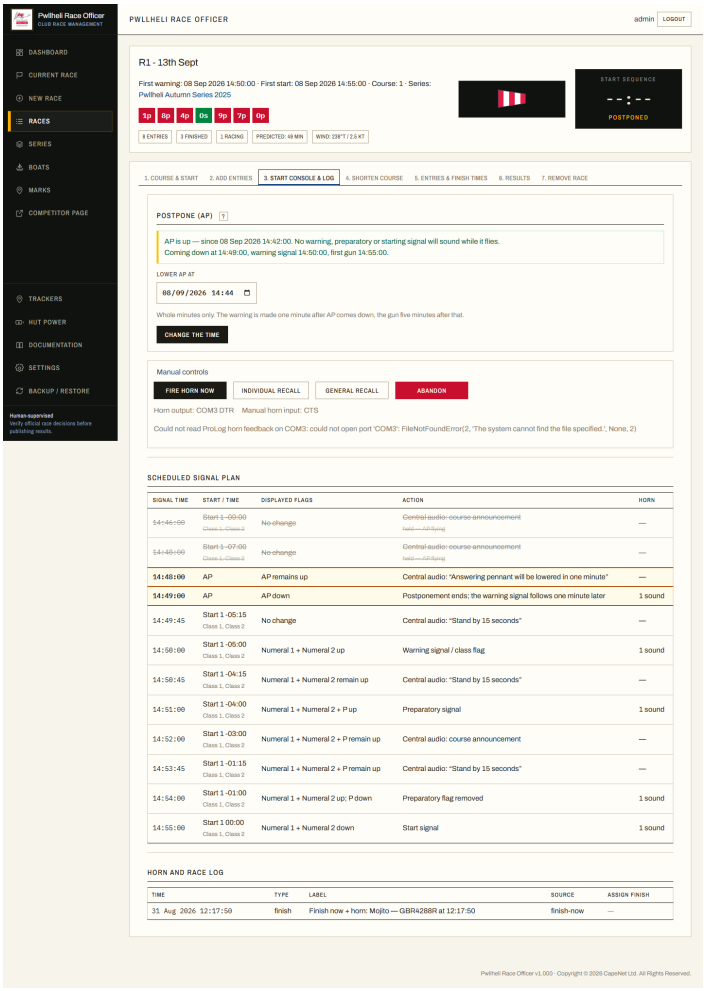

Choosing one sounds **two horn blasts**, holds the start sequence — nothing sounds while the flag is up — and shows AP on the race sheet, the competitor pages and the clubhouse display. The race keeps its scheduled time; the flag is what changed.

When the wind is back you say **when AP comes down**, in whole minutes, at least a minute and a half ahead. **The warning signal follows one minute later and the gun five minutes after that**, so 14:20 gives a warning at 14:21 and a first gun at 14:26. You are choosing when you are ready, not guessing when the wind will return — that is what the flag is for. The fleet hears the time when you set it, again if you change it, a minute before the flag moves, and once more as it comes down with its single sound.

Copyright © 2026 CapeNet Ltd. MIT licence.

IMPORTANT

AP postpones races that have *not started*. After the first gun it is not offered: stopping a race under way is abandonment (flag N), which this app does not signal — if the wind has died mid-race, **shorten the course** instead.

AP flying, with the minute it comes down set: the clock reads Postponed, and the signal plan shows what is held and what happens instead.

NOTE

If the hut PC is set up to make spoken VHF announcements and the radio is keyed by **VOX**, an admin can enable a short **wake-up tone** (Settings → Horn settings & Test) that plays a couple of seconds before each announcement, so the radio is already transmitting and the first words are not clipped.

Copyright © 2026 CapeNet Ltd. MIT licence.

CHAPTER 7

Shortening the course

If the wind drops or time runs short, you can shorten the course so boats finish at a rounding mark instead of sailing the whole course. Use the **4. Shorten course** tab on the race sheet (between **3. Start console & log** and **5. Entries & finish times**).

Choose the mark you want to finish at from the course sequence and select **Call shortened course**. The app then:

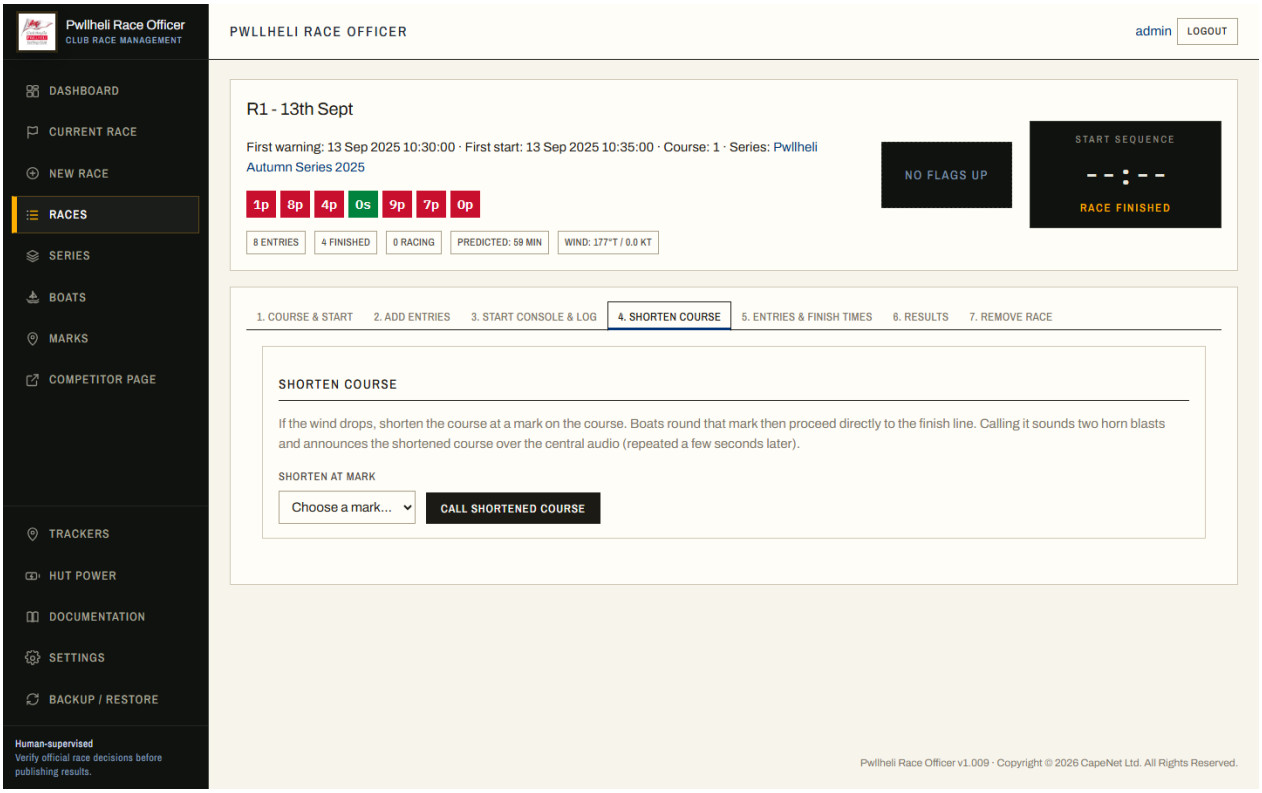

- sounds **two horn blasts**, and — once the horns have finished, so it is not drowned out — makes the central-audio announcement *"Shortened course called on mark <mark> — after this mark proceed to finish"*, repeated a few seconds later;
- flies International Code flag **S** (a blue square on white) in the flag panel on both the race sheet and the public competitor page, and keeps it up until all boats are no longer racing;
- shows a **Shortened course** banner and records the call in the race log;
- shortens the shown course (and the predicted-time / leg analysis) so it ends at that mark, with → **Finish** after it, and draws the final leg on the course chart as a dashed line from that mark straight to the finish line.

Boats round the chosen mark and then sail directly to the finish line as normal. Finish times are recorded on the **5. Entries & finish times** tab exactly as for a full course (Chapter 8), and results are calculated the same way. If you call it in error, select **Clear shortened course** to undo.

IMPORTANT

The spoken announcement is only heard over the VHF/PA if central audio is enabled on the hut PC. The race officer is still responsible for physically displaying Code flag S and for the on-the-water decision to shorten — the app signals and records the call, it does not make it for you.

Copyright © 2026 CapeNet Ltd. MIT licence.

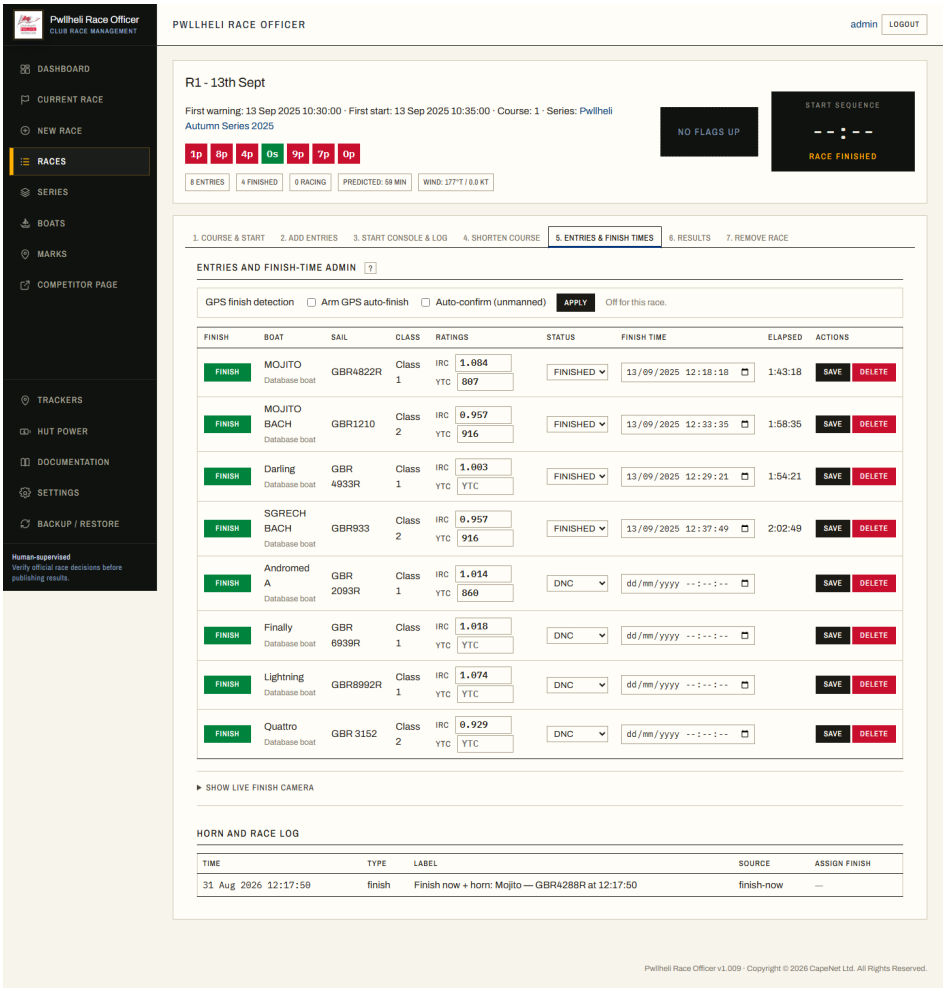

The Shorten course tab: pick a mark from the course and press Call shortened course.

Copyright © 2026 CapeNet Ltd. MIT licence.

CHAPTER 8

Recording finishes

As boats cross the line, use the **5. Entries & finish times** tab. Selecting the blue **Finish** button next to a boat records its finish time, sounds the horn and adds a log entry, all in one action. For boats that do not finish normally, set the appropriate status instead (see the status-code table in Chapter 2) — finish time is then left blank.

Entries & finish times: one row per boat, with its ratings, status, finish time and elapsed time. The horn/race log is below.

Each entry's IRC and YTC rating is editable here — useful if a correction is needed after the boat was originally entered. Remember to select **Save** on a row after making changes. A live finish-camera view can also be shown from this tab if one is configured: it starts as near-live stills and, where the club runs the public live stream, changes to smooth video from the relay.

IMPORTANT

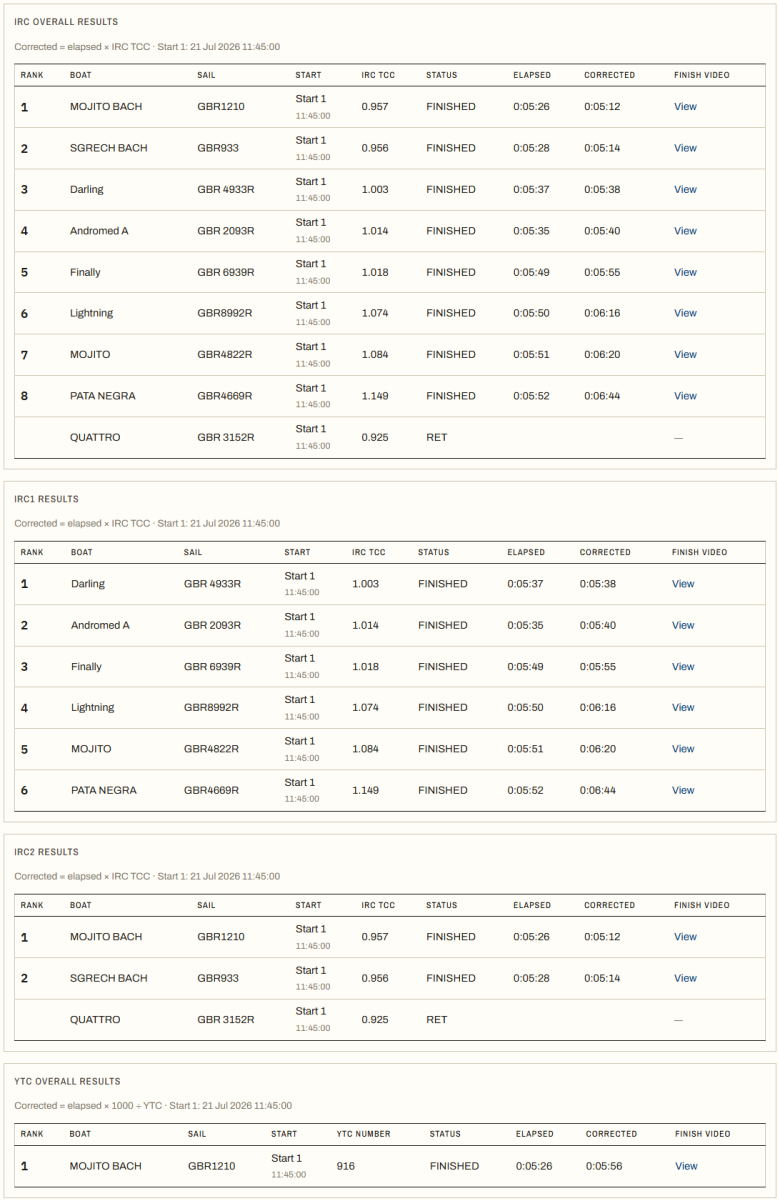

The relay video is a few seconds behind the water — it travels hut → relay → Cloudflare → back to you. Use it to watch, not to time: take finish times from the horn and check them against the recorded finish clips, which are cut from the hut's own recording. It also uses the hut's connection twice over, so on 4G keep the panel closed when you are not watching it.

Copyright © 2026 CapeNet Ltd. MIT licence.

CHAPTER 9

Race results

The **6. Results** tab calculates corrected results as soon as finish times and statuses are recorded — there is no separate “compute results” step. Separate tables are produced for IRC and YTC, further split by the series' rating-band classes, with an overall table where classes share a start.

IRC OVERALL RESULTS

Corrected = elapsed × IRC TCC · Start 1: 21 Jul 2026 11:45:00

Race results (1 of 2): the Results tab and IRC overall results, continuing into IRC Class 1.

Copyright © 2026 CapeNet Ltd. MIT licence.

Race results (2 of 2): IRC Class 2 and YTC results, with boats excluded from the YTC table for missing a rating listed below it.

Use **Sailwave CSV (IRC)** / **(YTC)** to export this race for import into Sailwave, where the club keeps its published history. It is an import file rather than a report to read — one row per competitor, one file per rating system, and no finishing places, because Sailwave scores from elapsed time and rating itself. For results a person reads — for your own records, or for a protest committee — use the HTML publish in Chapter 11.

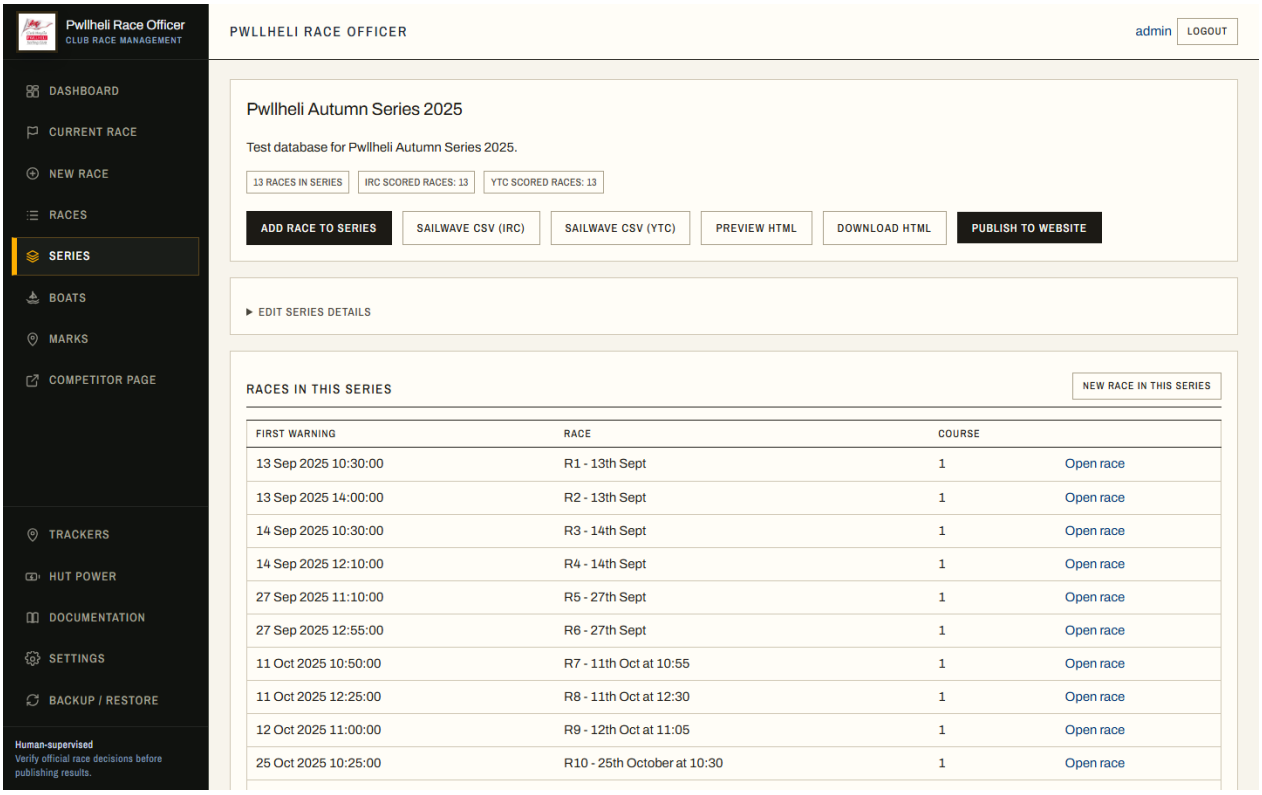

Competitors see the same classed tables on the public race page as soon as every boat has stopped racing: a **Leader board** tab appears there and opens first, while the entries, chart and course analysis stay available. Those last two switch to the **average wind over the race** (warning signal to last finish) as a record of the conditions, so nothing you do afterwards changes what they show.

Copyright © 2026 CapeNet Ltd. MIT licence.

CHAPTER 10

Series results

Back on the series page, scroll to **Series results**. Every scored race in the series feeds into these tables automatically — nothing needs to be recalculated by hand. Discarded scores appear struck through, ties are broken using RRS Appendix A8 (race ties use Appendix A7 equal-points scoring), and each table shows whether the class is yet constituted.

Series results: one table per rating-band class (and an overall table where classes share a start), with running totals and discards across every race sailed so far.

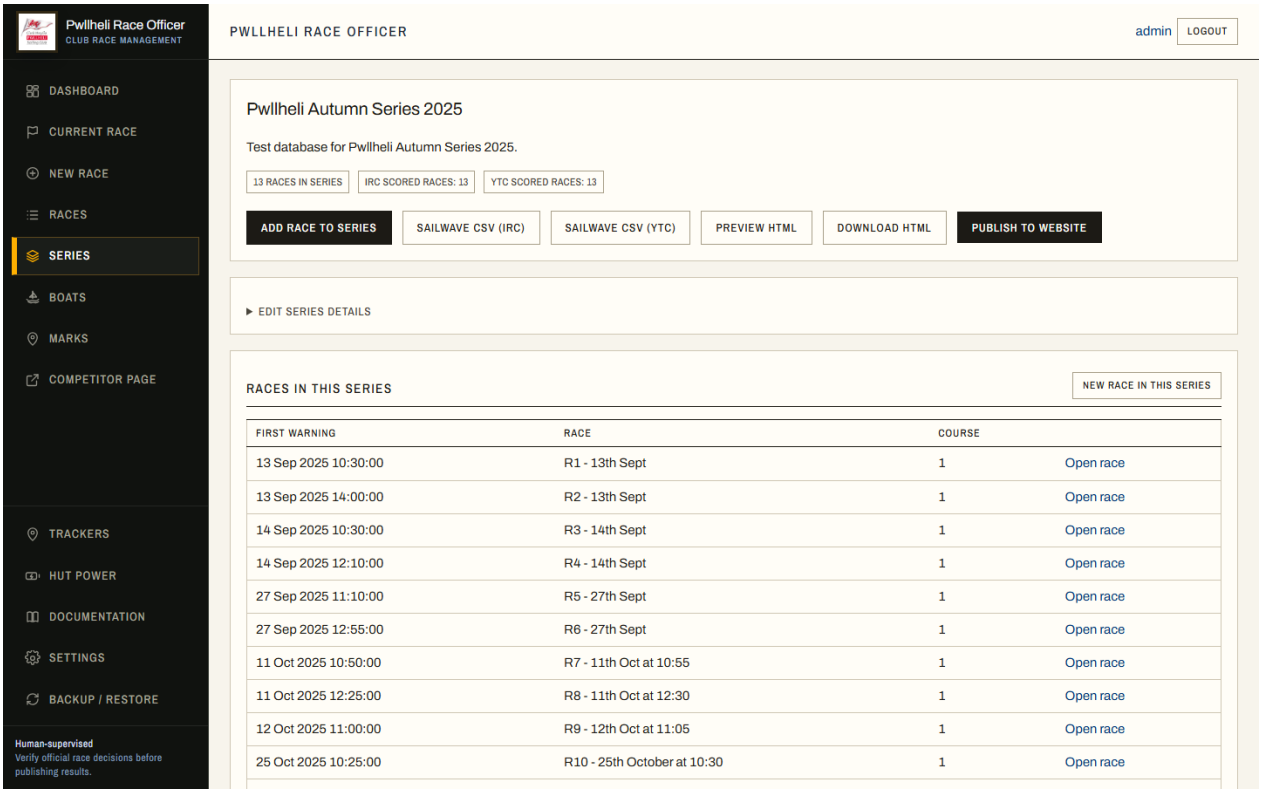

Copyright © 2026 CapeNet Ltd. MIT licence.

CHAPTER 11

Publishing results to the club website

Publishing happens from the **Series** page, not the individual race page — it always produces a complete standalone results document covering every race in the series. Four buttons sit next to **Add race to series**:

- **Sailwave CSV (IRC) / (YTC)** — every race in the series as one Sailwave import file, numbered by its position in the series so importing week by week does not overwrite race 1.
- **Preview HTML** — opens the results document in your browser to look at before sharing. It publishes nothing; the download beside it is the file you send.
- **Download HTML** — saves that same document as a single self-contained **.html** file.
- **Publish to website** — puts that same document straight onto the club's public web storage and gives you a link. This is the one to use at the end of a day's racing.

The series page toolbar: Add race to series, the Sailwave CSV exports, Preview HTML and Download HTML, above the list of races in the series.

Publish to website (v0.281) does the uploading for you. It sends the results as they stand to the club's public storage — the same place the race videos go — and each series gets its own folder there. The button appears only once an administrator has set that storage up in **Settings** → **Video recording**.

Every publish saves **two** copies. One is dated and never changes, so there is always a record of exactly what went out on Saturday evening. The other is always called **latest** and is overwritten each time you publish. **Put the latest link on the club website.** Paste it once and it keeps itself up to date for the rest of the season — you never have to touch the website again.

Published… beside the button lists everything that has gone out for that series, with the club-website link in a box to copy and each dated publish openable. Competitors see it too: the competitor home

Copyright © 2026 CapeNet Ltd. MIT licence.

page shows a **Published results** link on the series, pointing at the same document the club website shows.

Download HTML is still there for a club that would rather upload the file itself, through the website's own file manager or admin area.

The published results document: club/sponsor branding, a jump-to-race toolbar, and colour-coded 1st/2nd/3rd places in each results table.

IMPORTANT

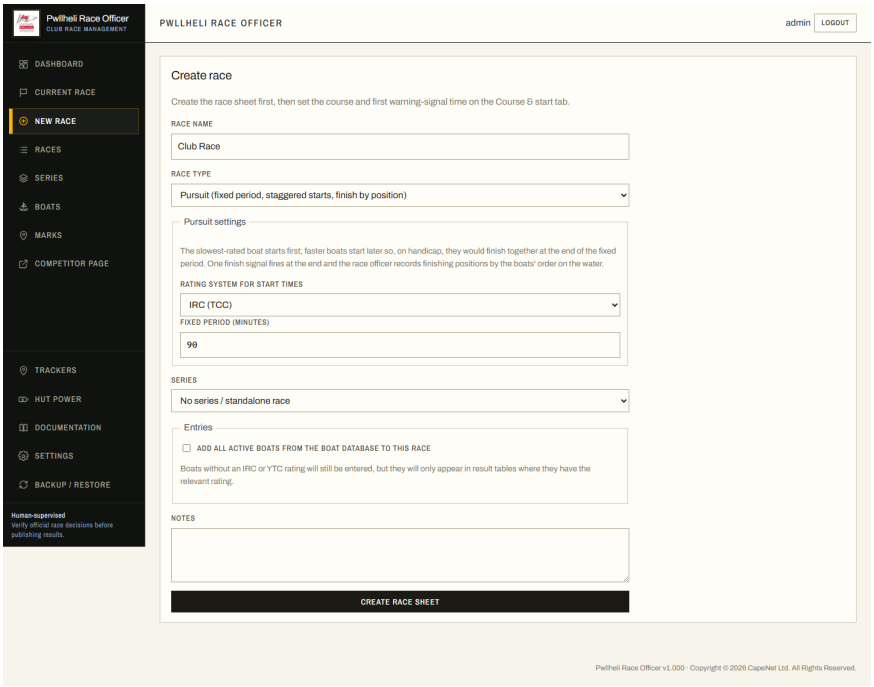

The published file is a **snapshot**, provisional as of the moment you published it. If you later correct a finish time, add a late entry, or a race is rescored, the club website keeps showing the old numbers until you publish again. Press **Publish to website** after every meaningful change — the link on the club website never needs touching, only the publishing does.

CHAPTER 12

Pursuit races

A **pursuit race** is an alternative to the class-based races covered so far. It runs for a fixed period; the slower boats start first and the faster boats later, so on handicap they would all finish together. There are no classes, and there is a single finish signal rather than individual finish times — the boats' order across the line *is* the result.

Creating a pursuit race: choose the Pursuit type, its rating system and the fixed period.

12.1 Setting it up

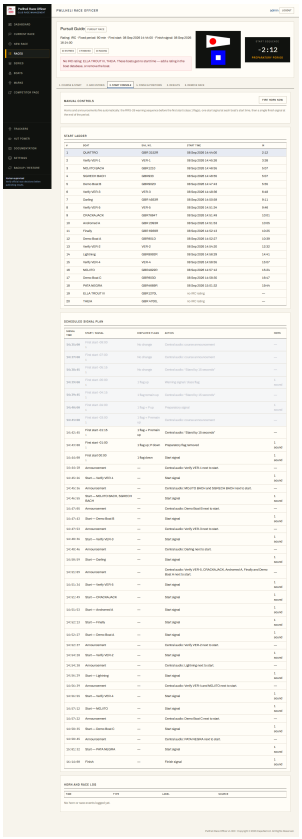

1. On the **New race** page choose **Race type** → **Pursuit**, pick **IRC** or **YTC** as the single rating system that sets the start times, and set the fixed period in minutes. You can add all active boats at the same time, just like a standard race.
2. On the race sheet's **Course & start** tab, set the **first warning-signal time** and save. The slowest-rated boat starts first, five minutes after the warning; every other boat's start time is worked out from its rating and recomputed automatically whenever you add or remove a boat.
3. Choose a course exactly as for a standard race — a fixed numbered course, **Recommend course**, or **Build manual course**.

> **NOTE**
>
> The slowest-rated boat starts first; each faster boat is delayed by **period × (1 − slowest speed ÷ boat speed)**, derived from the chosen rating. Until you have set the warning time and period, boats show **"set start time"** rather than a time — that is different from a boat with *no rating* in the chosen system, which is still entered but flagged separately so you can add a rating or leave it out. There are no classes in a pursuit race.

12.2 Running the start

Copyright © 2026 CapeNet Ltd. MIT licence.

The **Start console** works like the standard one: it shows the start ladder — every boat and its start time — with the next boat to start highlighted and a live countdown. Horns fire automatically: the five-minute warning sequence before the first start (flying the normal flags, defaulting to class 1), one start signal at each boat's start time, then the single finish signal at the end of the period. **Fire horn now** is there for a manual signal. There is a start video for each start time and no finish video.

The pursuit start console: the start ladder with the next boat to start highlighted.

12.3 Finishing and results

At the finish signal, judge the boats by their order on the water and record it on the **Finish & positions** tab — a position number and status for each boat. There is no time correction: the finishing order is the result, shown on the **Results** tab. If the pursuit race belongs to a series it scores into the standings by finishing position, exactly like the places in a normal race. Competitors see each boat's start time on the public race page (with the next to start highlighted), and the finishing order once you have recorded it.

Copyright © 2026 CapeNet Ltd. MIT licence.

CHAPTER 13

GPS tracking and automated finishes

If the club runs GPS trackers on the boats, you can watch the fleet live and let the app help record finishes. Positions are shown on your race sheet and, since v0.177, on the public competitor race page while the race is on. The trackers report to a tracking server on the relay, and the app pulls their positions.

13.1 Setting up trackers

Open the **Trackers** page from the bottom of the side menu (race officers can use it, not just administrators). The easiest way to add one is to switch the tracker on and look under **Trackers seen on the network** — devices the tracking server has heard from but that are not set up here yet appear in that list, most recently heard from first. Pick the boat it is on and press **Add**. There is nothing to type. That list is the only way in — a form for typing a 15-digit IMEI by hand was removed in v0.270.

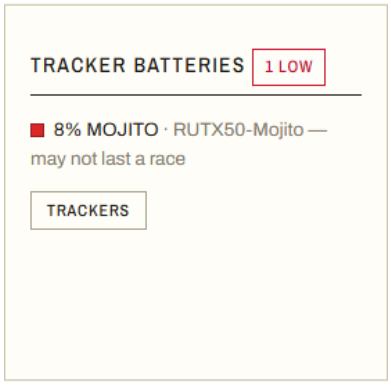

Each tracker shows how long ago it last reported with a coloured dot — green within 5 minutes, amber within the hour, red after that — and the page updates on its own. A boat's track always stays with the boat, so you can safely move a tracker to another boat between races.

> **NOTE**
>
> The trackers are battery units built for months of standby, so their normal reporting is far too slow to time a finish. Set a fast reporting rate for race days — and charge them between race days, because that fast rate costs a great deal more battery than the standby schedule does.

The **Type** column names each tracker's model, worked out from its IMEI. It is worth a glance, because the club's trackers are not alike: the small Teltonika asset tracker is the most accurate of them and will flatten in about nine hours of racing, while the Queclink units are less precise and will sail a long night race on around a tenth of their charge. If the app does not recognise a model it shows *unknown* and offers to let you name it. Administrators also get a **Commands** button for talking to a tracker directly; that is covered in the reference manual.

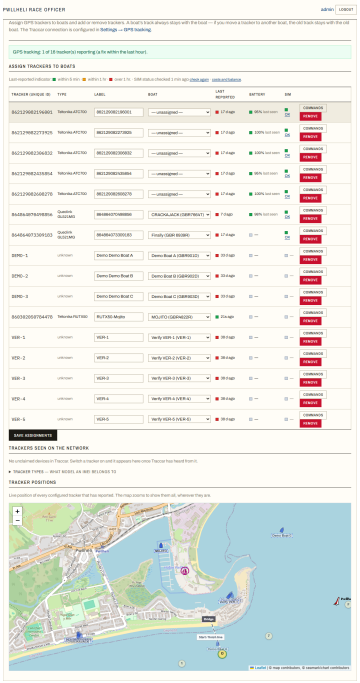

Which is why the tracker tables carry a **Battery** column, reported by the tracker itself with each position: **green** above 25%, **amber** at 25% or below, **red** at 10% or below. A tracker that has not reported one shows a dash rather than 0% — an unknown battery and a flat one are not the same thing, and the older units do not send it at all. The **Dashboard** warns when any tracker **assigned to a boat** is at or below 25%, flattest first, naming the boat, so a tracker due a charge is noticed on the Friday rather than at the outer mark. Spares on the shelf are left out of the warning on purpose: they are not going racing tomorrow.

Copyright © 2026 CapeNet Ltd. MIT licence.

The dashboard's reminder to put two trackers on charge.

A phone can be a tracker too. The free **Traccar Client** app reports in the same way: point it at the club's tracking server, give it a device name, then add that name on the Trackers page and assign it to a boat like any other. Useful for the rescue RIB or committee boat, for a volunteer's phone when there are more boats than trackers, and for trying the whole thing out before the hardware arrives. It does flatten a phone battery at race-day reporting rates. Your relay administrator has the server address.

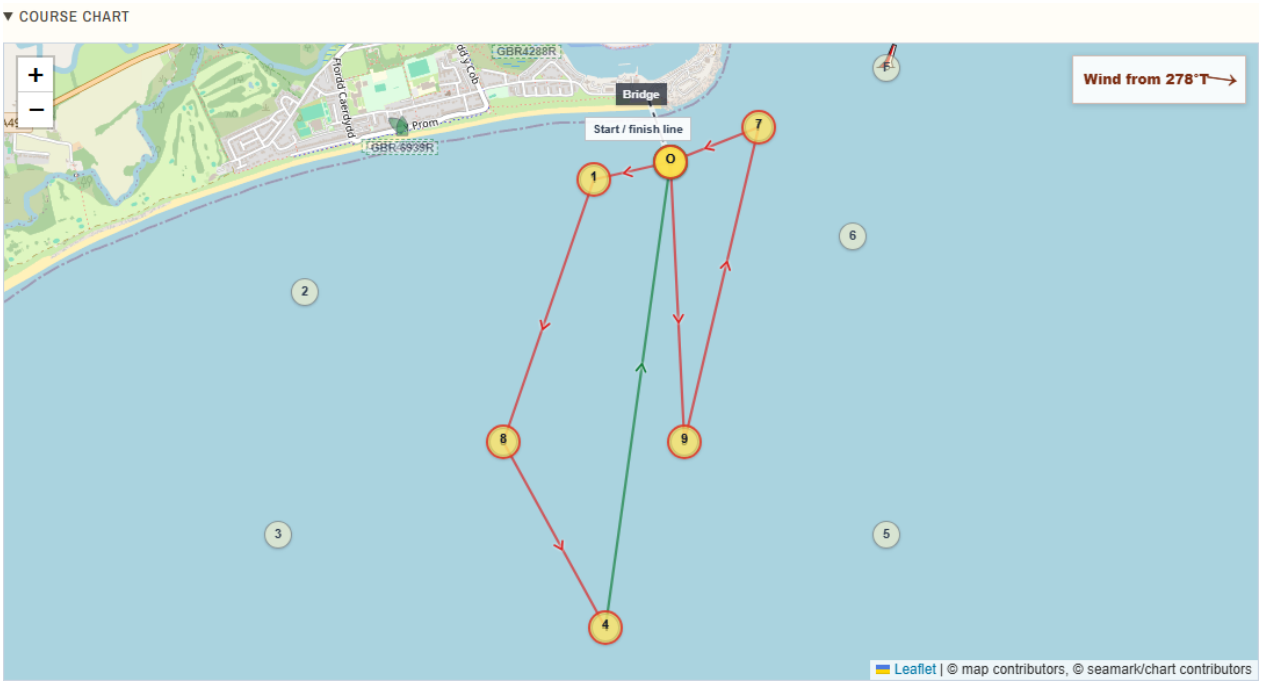

The Trackers page: assign each tracker to a boat; the dot shows how recently it reported.

13.2 The live map and position on the water

On the race sheet's **Course & start** tab, tracked boats appear on the course chart and in a live **Position on the water** list, ordered by how far round the course each boat is — the marks it has rounded, the next mark, and the distance still to sail.

Copyright © 2026 CapeNet Ltd. MIT licence.

The live fleet on the course chart.

▼ POSITION ON THE WATER (GPS)

Every boat entered in the race, ordered by how far round the course it is — this is the order on the water, not corrected for handicap. Tracked boats also appear on the course chart above; the list refreshes every few seconds. Assign trackers. ?

#	BOAT	SAIL	MARKS	NEXT	TO GO	SOG	FIX	SAILING TO
1	Mojito	GBR4288R	Finished	—	—	—	66s ago	—
2	Darling	GBR 4933R	—	—	—	—	No tracker	—
3	Mojito Bach	GBR 1210	—	—	—	—	No tracker	—
4	Sgrech	GBR 983	—	—	—	—	No tracker	—
5	Finally	GBR 6939R	1/7	8	4.58 nm	0.0 kn	13124m ago	← →
6	Andromed A	GBR 2093R	1/7	8	4.59 nm	0.0 kn	13975m ago	← →
7	Quattro	GBR 3152	—	—	—	—	No tracker	—
8	Lightning	GBR8992R	—	—	—	—	No tracker	—

Position on the water: every entered boat, ordered by progress round the course.

The app works through the course in order, and counts a mark as rounded on any of three tests: the boat passed within its **rounding radius** (50 m by default); or it crossed a **gate** through the mark reaching 750 m on the hand the course requires and only the radius on the hand it does not; or it came close and has since left again with the next mark nearer. It does not judge how tidy the rounding was, which is the fleet's business and not the race office's — but the gate does mean a boat giving a mark a wide berth on the correct side still counts, and it is the only part of the app that knows a mark has a required side at all.

A suspected wrong side is reported, never refused. Refusing it would stall that boat for the rest of the race and take its automatic finish with it, to enforce a rule the app does not adjudicate — you do, on a protest, with the video and the track.

Occasionally it still gets it wrong: a mark has dragged a long way, or the tracker slept through the rounding. The **arrows at the end of each row** put it right — **›** to count the next mark as rounded, **‹** to take one back. They stop at the ends, so you cannot go past the finish or before the start.

Copyright © 2026 CapeNet Ltd. MIT licence.

> **NOTE**
>
> A correction applies **from now on**, not backwards through the race, so it does not rewrite a chart replay the fleet may already have watched. It does reach the automatic finish detection: nudge a boat on to its last mark and its next crossing of the line can be taken as a finish. Every press is recorded in the activity log with who made it.

13.3 Automated finishes

Arm GPS auto-finish is already ticked on a new race, on the **Entries & finish times** tab; **Auto-confirm** is not. Once a boat has rounded every mark and crossed the line the app detects the finish, and that detection waits as a **proposal** — the boat and time, with a link to the finish video so you can check it — for you to confirm or dismiss. On a course that passes the start/finish mark part-way round, only the final crossing counts.

Tick **Auto-confirm** and the finish is recorded the moment it is detected, with nobody asked. That is what a race with an empty hut needs, and the on-the-water page ticks it by itself for a race started from a boat. For a race you are watching, leave it off: accepting a detection costs one click, and a wrong finish written straight into the results of a race still being sailed has to be spotted first.

> **NOTE**
>
> GPS gives the approximate time and order; the finish video is still the arbiter. On race days set the trackers to report often, or the timing between close boats will be too coarse.

If a boat plainly finished and got no automatic finish, the usual reason is the seaward end of the line. It is a laid buoy: it swings and it drags, and a boat that passes inside the real buoy but outside where the app thinks it is falls off the end of the line and is never seen crossing. The app now allows for that — a set distance past the mark still counts, 150 m on the club line and 250 m on the ISORA one — but that is for drift between measurements. **If a line mark has moved, re-measure it** from the Marks page, or from a phone alongside it. The shore end is a surveyed transit and never needs this.

Copyright © 2026 CapeNet Ltd. MIT licence.

13.4 What competitors see

The public race page gains a **Chart** tab showing the same fleet. It opens at the latest positions and can be wound back through the race so far, or played at up to 60x. Under it a **Leaderboard** panel rolls up over the chart offering the order on the water or, where the fleet is rated for it, an **IRC or YTC corrected** order.

For a boat still racing that corrected order has to **project** a finish time, and the competitor chooses how: **average pace since the start** (what it opens on — how much of the course the boat has covered and how long that took), **recent pace** over the last twenty minutes, or a **polar pace factor** comparing its time so far with the target time for the legs it has sailed. Whichever is picked drives the order *and* the times printed beside it, so the board cannot contradict itself. Nothing is shown for the first ten minutes of a race, counted from the gun, and the page labels the whole thing an estimate.

The simplest is the default, and not because it is the most accurate — it is not. Its error is much the same for every boat at any moment, because the whole fleet has just sailed the same slow beat; a leaderboard ranks boats against each other, so an error they all share cancels out.

> **NOTE**
>
> Expect to be asked about it. It is a competitor's toy, not a result: the Results tab and the scores you publish afterwards remain the authoritative record, and a boat's position on that live board carries no weight in a protest.

13.5 The clubhouse display

For a television in the club bar there is a page at **/bar** built for the purpose. It needs nothing from the race office: open it once on the TV, put the browser in full screen, and leave it.

- It follows the **current race** and moves on by itself when the club does — create a race or delete the one it was showing and the TV catches up within a few seconds, with nobody going to the bar to press anything.
- The chart fills the screen and **zooms to the boats still racing**, so the room sees the leg they are on rather than a whole course of empty sea.
- The leaderboards **cycle** beside it — order on the water, then IRC, then YTC — each boat with its **speed over the ground**, which is the number the bar argues about.
- The course is listed in the same **red and green** as the race sheet, so the room can see which way each mark is to be left.
- Before the start it shows the **countdown** with the **flags currently hoisted** beside it, newest first, right to left — the same flags, drawn the same way, as the flag panel in the race office.
- It cuts to the **start-hut camera** for the start, for each boat rounding the outer mark, and for each boat finishing, then goes back to the chart.

> **NOTE**
>
> There are no controls on the page at all — nothing for a stray remote or a curious member to press. It does need GPS tracking running to be worth putting up; without it there is nothing to draw.

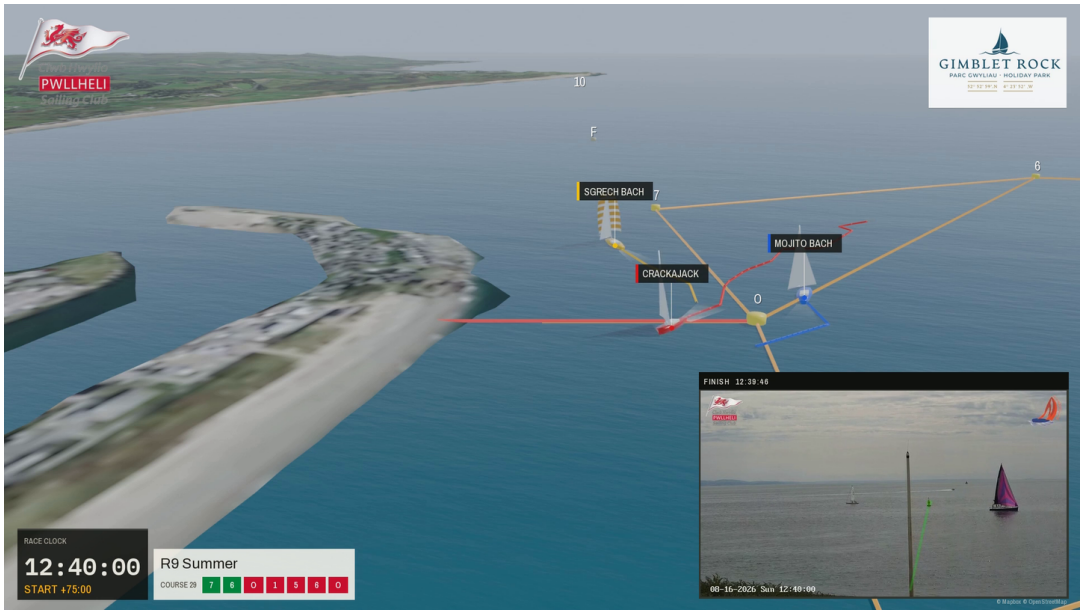

Copyright © 2026 CapeNet Ltd. MIT licence.

13.6 Replaying a race in the bar

13.7 A 3D film of the race

Beside that button on the same **Results** tab is **Render a 3D film**. It makes a film of the race in three dimensions - the fleet sailing the course they actually sailed, over the real coastline, trimmed to the wind of the moment, with the hut camera cut in at the start and at the finishes and the club's own branding on it. It is built from the tracks, the course, the wind log and the videos you already recorded, so there is nothing extra to do on the water.

- **The race-office PC does not make it.** It cannot - it is a fanless box that is also running the race. Pressing the button queues the job, and a separate render machine picks it up and does the work. Nothing happens at all until that machine is switched on, which is what the dashboard's **3D replay** card is there to tell you.
- **Allow about an hour.** A race takes about an hour on the club's render machine, so a film asked for when the racing ends is usually ready by the time the boats are packed away and the crews are in the bar. The page shows how far it has got.
- **Publish the race videos first** if you want the hut camera in it. The film is made either way; it simply has no camera inset for clips that have not been published, and the button says so before you press it.
- **Competitors get it by themselves.** Once the film exists a link appears on the public races list, on that race's public page and in the published results - nothing to send round.

A finish, from a film of a club race.

The same television will play a race back for people coming in from sailing. On the race sheet's **Results** tab, **Replay this race in the bar** puts it up: anybody signed in can start one, it touches no race data, and the TV switches itself over within a few seconds. Nobody goes near the screen.

- It runs from the **warning signal to the last finish** at six times life, so an afternoon's race fits into fifteen to twenty-five minutes. Beside the button it says roughly how long, before you start one.

Copyright © 2026 CapeNet Ltd. MIT licence.

- It drops to **normal speed whenever a video plays** — the start, the finishes, anything else recorded that day — and the clock follows the picture, so the boats on the chart stay with the boats in the video.
- The order on the water, the wind gauge and the flags all show **that moment of that race**, not now: the wind is what the station recorded at the time, and the flags are the ones that were flying.
- At the last finish it holds the **finishing order** for a minute and a half, then goes back to the current race by itself. **Stop the replay** on the same tab ends it early.
- Only one race replays at a time, and choosing another replaces it. A race needs a start time and at least one boat finished, or there is nothing to replay and the tab says so.

> **NOTE**
>
> Clips that would replay footage the one before already showed are skipped, so a fleet finishing close together does not put the same water up three times. Every clip is still on the race sheet. Clips recorded before v0.268 can sit a few seconds out against the camera's own burnt-in clock: they are cut from whole twenty-second segments of the buffer, and where that segment began was not recorded at the time.

CHAPTER 14

Good practice checklist

A few habits that make race days run smoothly with the app:

- Keep the race-office PC's clock accurate (NTP or GPS-disciplined where possible) and keep it visible — every signal time and finish time depends on it.
- Don't let the PC go to sleep during racing; the start sequence and horn scheduler need to keep running.
- Treat the flag panel and scheduled signal plan as a prompt, not a record — always confirm the physical flags on the mast match what the app expects.
- Supervise automatic horn and audio output rather than assuming it fired; use “Fire horn now” if in doubt.
- Handle protests and redress outside the app, then apply the outcome by editing the affected entry directly.
- Back up the **data/** folder (Backup / restore in the side menu) before using “7. Remove Race” to delete a race sheet — it cannot be undone.
- Glance at the **Off-site backup** card on the dashboard now and then. It shows how long ago the nightly encrypted copy last reached Cloudflare R2, and flags it when there has not been one — a backup that quietly stopped is worse than none, because everyone assumes there is one.
- Re-publish (Download HTML, and the Sailwave CSV if you score in Sailwave) after any post-race correction, so the club website and your records stay in step with the app.

For deeper detail on any of these topics — hardware setup, video recording, the weather station, backups, or troubleshooting — see the full documentation set in the app's **docs/** folder, including **SERIES_SCORING.md**, **WEBSITE_PUBLISHING.md**, **FLAGS_AND_START_SEQUENCE.md** and **OPERATIONAL_CHECKLIST.md**.

Copyright © 2026 CapeNet Ltd. MIT licence.

CHAPTER 15

The Virtual Race Officer

Everything above is done on the race sheet, in the hut. It can also be done from a boat. The **Virtual Race Officer** at **/vro** is one page — a box to type in, the conversation, and a **Yes** button — for a race officer with a phone in one hand and a tiller in the other. Type a sentence, read back what it would do, agree to it. Every command goes through the same code the race sheet uses.

- *"create a race at 11am"* — it asks which series the race is in, suggesting the series the last race was in, and what it is called, suggesting the last race's name. A race in a series is entered with the boats already racing in it, and the read-back names them. A course is chosen for the wind at that moment if you agree to it.
- *"put the start back ten minutes"*, *"use course 4"*.
- *"add Mojito and Sgrech Bach"*, *"the same boats as last time"* — and every active boat in the database only when you ask for that, because most of them are not racing.
- *"Mojito's finished"* — the race sheet's **Finish** button: the finish is recorded the moment you press **Yes**, and the horn sounds.
- *"where's Mojito?"*, *"how fast are they going?"*, *"where was Jackdaw at 19:20?"* — from the trackers.
- *"will the wind build during the race?"* — from a weather forecast on the internet.
- *"make me a windward-leeward twice round, O to 4"* — a made-up course, read back mark by mark before it is set, and changed the same way.
- *"how many courses are there?"*, *"where is mark 4?"*, *"what sail at 12 knots?"* — a look-up in the club's own data.
- *"shorten at mark 4"* — two horn blasts and the announcement, after you confirm.
- *"how are they getting on?"*, *"what course would you use?"*, *"are the trackers working?"*

> **NOTE**
>
> **Nothing happens until you agree to it.** The read-back is the only check that catches the mistake where the app understood you perfectly and it was not what you meant — a race at 11 tomorrow rather than today, the wrong fleet, the right command aimed at yesterday's race. A proposal lapses after five minutes, and saying the same thing twice does it once.

It is a permission of its own — **VRO**, ticked per account in **Settings** → **Users** — and no role grants it, administrators included. It flies AP and lowers it, but it cannot signal a recall or abandon a race, and it never sounds the horn on its own — only for a finish, a shortened course or a postponement, exactly as the race sheet does. There is no *arm* step to withhold: with start automation on the horn sequence follows the race's stored warning signal, so moving that time from the water moves the horn.

It reads ordinary English, and a **model must be configured** for it to read anything at all: with none, the page says the feature is not available and offers no box to type in. The app's own small grammar used to answer instead, and six sentence shapes on a page inviting plain English read as an app that understands nothing. The cost is that the racing goes back to the race sheet when the hut's outbound internet is down. Full detail is in **VIRTUAL_RACE_OFFICER.md**.

Copyright © 2026 CapeNet Ltd. MIT licence.

NOTE

A race created from this page has **Arm GPS auto-finish** and **Auto-confirm (unmanned)** both on, and says so when it creates it: nobody is in the hut to press **Finish**, which is the whole premise. They are the ordinary tick boxes on the **Entries & finish times** tab and can be turned off there.

A course nobody has chosen

A new race stores a fixed course number as a fallback, so that the geometry the chart and the leg analysis work from exists before anybody has chosen anything. It is not a decision, and since v0.276 nothing shows it as one: until a course is chosen the race sheet and the competitor page both read **Course not set**, the course picker reads **Course not set**, there is no course board, nothing is drawn on the chart, there is no predicted time, and **the spoken VHF course announcement stays silent** — a fleet sent round a course nobody picked is a general recall at best.

Choosing one from the picker and saving is what makes it a decision; so is recommending or building one. You can still save the tab with the picker left on **Course not set** — setting the first warning signal before the course is known is an ordinary thing to do on a race morning — and the race simply stays without a course.
